Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	10 October 2022
Team ID	PNT2022TMID43965
Project Name	Project – News Tracker Application
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through online applicationRegistration through Gmail Registration through website
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP
FR-3	User login	Login through browser directly by enteringusername and password Login through Login through email
FR-4	User interaction	Done through user interface between clientand server View the related news by subscripted or requested page
FR-5		Application have tools to share this news in social networks

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	**Usability**	End users can receive push updates for new content on a site by subscribing to thesite's news feed
NFR-2	**Security**	How well are the system and its dataprotected against attacks
NFR-3	**Reliability**	How often does the system experience critical failures? How much time does it take to fix the issue when it arises ?And how is user availability time compared todowntime?
NFR-4	**Performance**	Performance is the core non-functional requirements no system can do without. Itdefines how fast a software system or a particular piece of it responds to certain users actions under a certain workload. Inmost cases, this metric explains how longa user must wait before the target operation happens (the page renders, a transaction is processed, etc.) given the overall number of users at the moment. But it's not always like that. Performancerequirements may describe background
		processes invisible to users, e.g. backup.

		But let's focus on user-centric performance.
NFR-5	**Availability**	Availability describes how likely the system is accessible to a user at a given point in time. While it can be expressed as an expected percentage of successful requests, you may also define it as a percentage of time the system is accessible for operation during some time period. For instance, the system may be available 98 percent of the time during a month. Availability is perhaps the most [business](https://www.altexsoft.com/blog/business-requirements-document/) HYPERLINK "https://www.altexsoft.com/blog/business-requirements-document/"[-](https://www.altexsoft.com/blog/business-requirements-document/) HYPERLINK "https://www.altexsoft.com/blog/business-requirements-document/"[critical requirement,](https://www.altexsoft.com/blog/business-requirements-document/) but to define it, you also must have estimations for reliability and maintainability.
